Recall: the Length of a Plane Curve

Fact

Suppose that a plane curve has parametric equations $x = f(t)$ and $y = g(t)$, $a \leq t \leq b$. The **length** is given by the formula

$$\begin{aligned} L &= \int_a^b \sqrt{[f'(t)]^2 + [g'(t)]^2} dt \\ &= \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt. \end{aligned}$$

The Length of A Space Curve

Definition

The Length of A Space Curve

Definition

- The length of a space curve $\mathbf{r}(t) = \langle f(t), g(t), h(t) \rangle$ is

$$\begin{aligned} L &= \int_a^b \sqrt{[f'(t)]^2 + [g'(t)]^2 + [h'(t)]^2} dt \\ &= \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} dt. \end{aligned}$$

The Length of A Space Curve

Definition

- The **length of a space curve** $\mathbf{r}(t) = \langle f(t), g(t), h(t) \rangle$ is

$$\begin{aligned} L &= \int_a^b \sqrt{[f'(t)]^2 + [g'(t)]^2 + [h'(t)]^2} dt \\ &= \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} dt. \end{aligned}$$

- **Note that**

$$L = \int_a^b |\mathbf{r}'(t)| dt.$$

Examples

Examples

Examples

- Find the length of the arc of the circular helix with vector equation $\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k}$ from the point $(1, 0, 0)$ to the point $(1, 0, 2\pi)$.

Examples

- Find the length of the arc of the circular helix with vector equation $\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k}$ from the point $(1, 0, 0)$ to the point $(1, 0, 2\pi)$.
- Find the point where you have to stop if you want to travel only half of the previous length.

Examples

- - Find the length of the arc of the circular helix with vector equation $\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k}$ from the point $(1, 0, 0)$ to the point $(1, 0, 2\pi)$.
 - Find the point where you have to stop if you want to travel only half of the previous length.
- Find the length of the curve $\mathbf{r}(t) = t^2 \mathbf{i} + 2t \mathbf{j} + \ln t \mathbf{k}$ with $0 \leq t \leq 1$.

Motion in Space: Velocity and Acceleration

Definition

Definition

- Let $\mathbf{r}(t)$ be a space curve. The **velocity vector** $\mathbf{v}(t)$ at time t is

$$\mathbf{v}(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h} = \mathbf{r}'(t).$$

Definition

- Let $\mathbf{r}(t)$ be a space curve. The **velocity vector** $\mathbf{v}(t)$ at time t is

$$\mathbf{v}(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h} = \mathbf{r}'(t).$$

- The **speed** of the particle at time t is the magnitude of the velocity, that is, $|\mathbf{v}(t)|$.

Definition

- Let $\mathbf{r}(t)$ be a space curve. The **velocity vector** $\mathbf{v}(t)$ at time t is

$$\mathbf{v}(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h} = \mathbf{r}'(t).$$

- The **speed** of the particle at time t is the magnitude of the velocity, that is, $|\mathbf{v}(t)|$.
- The **acceleration** of the particle is defined as the derivative of the velocity:

$$\mathbf{a}(t) = \mathbf{v}'(t) = \mathbf{r}''(t).$$

Example

Example

- Find the velocity, acceleration, and speed of a particle with position vector $\mathbf{r}(t) = \langle t^2, e^t, te^t \rangle$.

Example

- Find the velocity, acceleration, and speed of a particle with position vector $\mathbf{r}(t) = \langle t^2, e^t, te^t \rangle$.
- Find the velocity and position vectors of a particle that has the acceleration $\mathbf{a}(t) = -10\mathbf{k}$, initial velocity $\mathbf{v}(0) = \mathbf{i} + \mathbf{j} - \mathbf{k}$ and initial position $\mathbf{r}(0) = 2\mathbf{i} + 3\mathbf{j}$.

Example

A projectile is fired with an angle of elevation of $\pi/6$ and initial velocity of 1200km/sec. Where does the projectile hit the ground and with what speed?

Example

A projectile is fired with an angle of elevation of $\pi/6$ and initial velocity of 1200km/sec. Where does the projectile hit the ground and with what speed?

- Recall: **Newton's Second Law of Motion**

$$\mathbf{F}(t) = m\mathbf{a}(t).$$

- So

$$\mathbf{F}(t) = m\mathbf{a} = -mg\mathbf{j},$$

where $g = |\mathbf{a}| \simeq 9.8m/s^2$.
